PROGRAM SUMMARY

**Rolando E. Rumbaut,
MD, PhD**

Director, MeRIT Program,
Vice Chair for Research,
Department of Medicine,
Baylor College of
Medicine

**Richard J. Hamill,
MD**

Director, Medicine
Residency Program,
Department of Medicine,
Baylor College of
Medicine

The Department of Medicine at Baylor College of Medicine has a long-standing commitment to the career development of the next generation of academic physician-scientists. Baylor provides an exceptional environment for clinical and research training. Our physician-scientist training program (PSTP) is named the MeRIT (Medical Resident Investigator Track) program. The MeRIT program fulfills the requirements of the **American Board of Internal Medicine (ABIM) research pathway**.

The depth and breadth of opportunities for MeRIT Program training with preeminent investigators are truly remarkable, with opportunities in basic science, clinical, translational, and health services research. The MeRIT program allows residents to pursue their research interests with faculty from Baylor and affiliated academic institutions. This brochure provides a very small sampling of the many faculty members committed to serve as primary mentors for MeRIT trainees. A broader listing of the extensive research opportunities and potential mentors available for MeRIT trainees can be found by browsing through the list of the many interdisciplinary **research centers** at Baylor College of Medicine.

The curriculum involves two years of clinical training (instead of the usual three years) and three uninterrupted years of research training. The three years of research training can be performed at the end of the two years of clinical residency, or they can be performed at the end of subspecialty training at Baylor. Thus, each MeRIT scholar has the ability to tailor their research training experience to maximize career development. During the three research years, the primary clinical experiences will consist of at least one half-day per week in a continuity clinic. Furthermore, one of the research years can be used to fulfill the research requirement for subspecialty board certification. In addition to the primary research mentor, each trainee will have a defined mentoring committee. Research training is integrated with Baylor's **Clinical Scientist Training Program** and interested trainees have the option of pursuing an advanced graduate degree.

Internal medicine residents selected for the MeRIT Program are expected to be among the top applicants, not only on the basis of extraordinary clinical competence but also on commitment to pursuing academic careers as physician-scientists. MeRIT scholars are assured funding for the entire five years of the program, and are anticipated (though not required) to pursue subspecialty training at Baylor. As you make plans for residency training, we encourage you to consider the MeRIT Program and think about collaborating with its distinguished group of faculty.

CHRISTIE BALLANTYNE, MD

PRIMARY DEPT. AND SECTION

Medicine - Cardiology and Cardiovascular Research

RESEARCH INTERESTS

- Atherosclerosis
- Inflammation
- Leukocyte-endothelial adhesion molecules
- Biomarkers for atherosclerosis and cardiovascular disease
- Preventive cardiology and atherosclerosis imaging
- Precision medicine
- Lipids
- Obesity, metabolic syndrome, and diabetes
- Genetics of lipid disorders, atherosclerosis, and cardiovascular disease
- Coronary artery disease

RESEARCH OPPORTUNITIES FOR TRAINEES

- Ongoing clinical trials in the area of lipids and atherosclerosis
- Genomic studies related to personalized medicine with the Human Genome Center at Baylor
- Population health and biomarker research involving the NIH-funded Atherosclerosis Risk in Communities cohort with a focus on cardiovascular disease in the elderly and healthy aging

RELEVANT PUBLICATIONS

IVAN O. ROSAS, MD

PRIMARY DEPT. AND SECTION

Medicine - Pulmonary, Critical Care, and Sleep
Medicine

RESEARCH INTERESTS

The long-term goal of our pulmonary research program is to better understand pathologic mechanisms that contribute to development and progression of parenchymal lung disease thereby enabling us to develop novel diagnostic and therapeutic strategies. Our clinical research studies have shown that subclinical pulmonary fibrosis can be detected in at-risk populations including families affected with pulmonary fibrosis, smokers and patients affected with rheumatoid arthritis. These studies are transformative as they provide critical evidence that prevention is feasible in common parenchymal lung diseases associated with high morbidity and mortality. Our mechanistic research studies focus on Idiopathic Pulmonary Fibrosis (IPF) and Chronic Obstructive Pulmonary Disease (COPD), we employ cutting edge genomic technologies and animal models to determine how select molecular derangements contribute to development and progression of lung disease

RESEARCH OPPORTUNITIES FOR TRAINEES

- Detection of subclinical interstitial lung disease in at risk populations using molecular markers
- Phenotypic and molecular overlap of primary and inflammatory lung fibrosis
- Validation of IPF and COPD molecular targets identified through single-cell RNA sequencing

RELEVANT PUBLICATIONS
