"Epigenetics in liver tumors: mechanisms and therapeutic targets"

Matias Avila, Ph.D.
Director Hepatology Program
CIMA. University of Navarra
Pamplona, Spain

About this seminar: Understanding the molecular and cellular mechanisms involved in the development of liver tumors is essential for the elucidation of effective therapies. Epigenetic processes are fundamental for the preservation of cellular differentiation and function, however; it is increasingly recognized that epigenetic alterations impact on all hallmarks of cancer. Interestingly, most of epigenetic mechanisms are amenable to pharmacological intervention. In this presentation the role of epigenetics in liver carcinogenesis will be highlighted. Recent findings on relevant epigenetic targets and their pathogenic role in different types of liver tumors will be discussed.
